Engis puts Bore Finishing Capability onto Machining Centres

Engis UK is offering a tooling solution that transforms bore finishing from a bespoke machine operation and turns it into a standard, repeatable and cost effective machining process that can be undertaken on standard vertical and horizontal CNC equipment.

The tooling's innovative design overcomes issues caused by lack of height within machining centres and removes the need for floating tool holders and adaptors, while still providing extremely high accuracy geometry e.g. roundness to within 1 micron, surface finish down to 0.2Ra.

This solution is suitable for many applications including the manufacture of hydraulic valves, aerospace and F1 components.
