**Release Date: June 2014**

### **FLEXIBLE FLUID POWER SOLUTIONS**

Leading UK fluid power distributor Tom Parker Ltd. announces an expansion to their extensive range of Filters, Regulators & Lubricators (FRL) from long-established core brand Master Pneumatic Inc. (MP).

Originating in 1950 (in the US town of Detroit) MP began life as a parts supplier to the automotive industry. As the industry boomed MP expanded its product range into other markets and applications. Over the last fifty years they have successfully evolved into a global manufacturer and distributor with over 700 custom products to support the broad yet specialist needs of each of their customers. Their product range is now used in a wide assortment of markets including construction, food, beverage and medical. Such is the faith of MP in the quality of their products; they supply a seven-year warranty with every item.

The knowledge and attention to detail of MP is well demonstrated with the introduction of their latest range of intermediate sized multi-purpose FRL's for compressed air; brought to the UK fluid power market exclusively by Tom Parker Ltd.

The new Series 350 products offer users the same high quality of the existing MP Guardsman I & II ranges but also feature enhanced flexibility and improved performance. Suitable for modular or in-line mounting, all models are available to buy in 1/4", 3/8" & 1/2" port sizes and produced in die-cast zinc for durability with nitrile seals. The impressive range combines aesthetically pleasing design with functionality and adaptability to enable a bespoke solution for any requirement.

Compatible with products from the already popular 380 modular series; 350 models are provided with BSPP port threads as standard or the option of NPTF threads. The F350 General Purpose Filter model affords users exceptional performance in the removal of free water and provides up to 98% efficiency; as does the CFR350 Integral Filter/Regulator. The FC350 Coalescing Filter model is designed to remove 99.98% particulate material - free oils and solid contaminants of 0.3 microns or greater. Used following a F350 General Purpose Filter, this model provides exceptional coalescing properties and comes with a differential pressure gauge to indicate when the filter element requires changing and ensure optimum performance.

Both regulator and combined filter regulator models R350 & CFR350 provide a diaphragm style pressure regulator that produces superior performance, a large sensing area and a self-relieving design (non-relieving also available) which incorporates a reverse flow option. Model L350D modular lubricator benefits from a transparent dome to display oil delivery and an adjustable knob, removable for tamper-resistance.

All filter and lubricator products from the range come complete with manual drain, Polycarbonate plastic bowls and shatter-guards as standard, with MP continuing to deliver all-important application diversity through automatic float drain and metal bowl upgrades both available upon request. Models F350, FC350 & L350D come supplied with blue caps as standard but likewise offer flexibility featuring colour options in red, yellow or grey available for use with visual management systems. Other custom colours are available to order on request subject to minimum order quantities.
